## Export

Command	Meaning
<code>Export-csv</code>	
<code>Export-Clixml</code>	
<code>Out-File</code>	
<code>Out-Printer</code>	
<code>Out-GridView</code>	
<code>Out-File</code>	
<code>ConvertTo-Csv</code>	
<code>ConvertTo-Html</code>	

## Pipeline

Example: you want to check if a service is running on all the computers in the AD

Command	Meaning
<code>Get-ADComputer -Filter *   gm</code> <code>Get-Help Get-Service -ShowWindow</code>	Check what object you are working with (in this case <code>ADComputer</code> ) Search for <code>-InputObject</code> and see what it accepts (in this case <code>ServiceController</code> != <code>ADComputer</code> ) <code>-ComputerName</code> supports <code>ByPropertyName</code>
<code>Get-ADComputer -Filter *</code>	Check for <code>propertyname</code> <code>-Name</code> gives you the name of the computer

```
Get-ADComputer -Filter * -Name | Select -Property @{n(ame)='ComputerName';e(xpression)={$_.name}} |  
Get-Service -Name bits
```

Example: command does not accept pipeline input (`Get-WmiObject`)

```
Get-WmiObject -class win32_bios -ComputerName (Get-ADComputer -Filter *).Name
```

Or

```
Get-ADComputer -Filter * | Get-WmiObject win32_bios -Computername {$_.Name}
```

## Create new property

Command	Meaning
<code>Select -Property @{n(ame)='ComputerName';e(xpression)={\$_.name}}</code> <code>Select -ExpandProperty name</code>	Creates a new property called <code>ComputerName</code> from the Return the property in a array

## WmiObject & CimInstance

## Remoting

Command	Meaning
<code>Invoke-Command -ComputerName dc {Restart-Computer}</code> <code>icm dc {Restart-Computer}</code>	Execute the command on specific computers Short version

## Execution Policy

Command	Meaning
<code>Restricted</code> <code>Unrestricted</code> <code>AllSigned</code> <code>RemoteSigned</code> <code>Bypass</code> <code>Undefined</code>	Run any script ( <b>not recommended</b> ) Only run scripts that are remote signed

## Powershell Remote Session

Command	Meaning
Get-PSSession	Get open sessions
\$sessions = New PSSession -ComputerName dc	Open session
icm -Session \$sessions {...}	Execute command in script block to all sessions

## Parallelism

**Parallel:** `icm -Computername (Get-Content servers.txt) { ... }`

**Serial:** `foreach ($s in (Get-Content servers.txt) ) { icm -Computername $s { ... } }`

## Scripting

Command	Meaning
CTRL + J	Helps you build a script
\$var = 1	Declares new variable <b>var</b> with value 1
param(\$ComputerName)	Create new parameter
[ValidateSet("a","b","c")][string]\$x = "a"	Value of \$x <b>must</b> be a value of the ValidateSet
